DETAILED ACTION

1. Claims 1,2,4-9,13,15,20,21,23 and 24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Blackwell et al (5,152,819) in view of Nakahara et al (4,419,116), Koide et al (5,425,795) or Terashima et al (5,423,898) and Roba et al (6,672,110).

Blackwell et al discloses a process for making an optical fiber glass preform. Silica precursor is mixed with a metal oxide dopant precursor, Ti oxide precursor and reacted in a soot burner to form soot. The soot is deposited on a rotating mandrel and subsequently consolidated in a He and Cl atmosphere. Blackwell et al is silent as to the minimum temperature of the soot deposition and the translation motion of the mandrel. Inherently, the temperature during soot deposition is below the temperature at which the soot particles consolidate otherwise there would be solid fused glass instead of a soot preform. In any case, Roba et al teaches it is advantageous that the temperature of the soot preform during soot deposition be at a temperature of between 700 and 1200° C. Note that Roba et al includes Ti doped soot preform, penultimate paragraph, column 5. It is also noted that "successive translating the deposition surface away from the burner", is an obvious conventional feature of devices used to form the soot preform and of which Koide et al, Nakahara et al or Terashima et al are cited as evidence.
